Introduction

This example shows how to configure and use an autonomous IOS (aIOS) AP, running in Workgroup Bridge (WGB) mode, with EAP-TLS authentication, in a Cisco Unified Wireless Network (CUWN). In this example, a Microsoft Certification Authority (Windows 2003) issued the certificates of the WGB and through the copy-and-paste method, these certificates are manually entered on the WGB. ACS acts as the RADIUS server. WPA1/TKIP encryption with 802.1X key management is used.

Prerequisites

Requirements

Ensure that you meet these requirements before you attempt this configuration:

- Knowledge of Cisco Autonomous solution and Cisco IOS-based Access Points.
- Knowledge of Light Weight Access Point Protocol (LWAPP)

Components Used

The information in this document is based on these software and hardware versions:

- WGB that runs Cisco IOS® Software Release 12.4(10b)JA2It is important to use Cisco IOS Software Release 12.4(10b)JA2 or later for these reasons:Cisco bug ID CSCsl85710 (registered customers only) —802.11a WGB cannot disable DFS channels or enable 'mobile station'Cisco bug ID CSCsl85798 (registered customers only) —After DFS event, WGB does not rescanCisco bug ID CSCsm37686 (registered customers only) —WGB configured for TKIP-only cannot assoc to (WPA+TKIP)+(WPA2+AES)Cisco bug ID CSCsk85945 (registered customers only) —WPA1 WGB can't associate to a WPA1+WPA2 WLANCisco bug ID CSCsk52437 (registered customers only) —WGB retransmit fails when AP goes offchannelCisco bug ID CSCsb85791 (registered customers only) —1130 crashes just after installation of the new imageCisco bug ID CSCsk63882 (registered customers only) —Bad Id error with traceback seen when 12.4-Based 802.11 AP comes upCisco bug ID CSCsl36227 (registered customers only) —Tracebacks on WGB: %SM-4-BADEVENT: Event 'eapResp' is invalidCisco bug ID CSCsl46209 (registered customers only) —WGB 1242 11g radio stuck in reset, stops transmittingCisco bug ID CSCsl58071 (registered customers only) —WGB intermittently takes a long time to reauthenticate in EAP-TLS
- WLC that runs version 4.2.99.0It is important to use 4.1.185.0 or later for this reason:Cisco bug ID CSCsk41360 (registered customers only) —Controller continues processing EAPOL LOGOFF after receiving EAPOL

Note: You need to be a registered customer in order to view the details of the bug.

The ACS was running 4.1; the CA was running Microsoft Windows 2003 Advanced Server SP1. In all cases, when you browsed to the CA, the client browser was Internet Explorer with Active X enabled.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

Refer to the Cisco Technical Tips Conventions for more information on document conventions.

Configuration Overview

1. Bring up the Microsoft CA (If Necessary)
2. Install the Server Certificate in the ACS
3. Install the CA Certificate on the ACS
4. Setup the ACS to Use the Server Certificate
5. Configure ACS to let the WGB authenticate in EAP-TLS
6. Configure the WLAN of the WLC to Authenticate to ACS
7. Configure the Certificates of the WGBSet the hostname, domain name and time as neededConfigure the trustpoint.Install the CA certificate.Generate the AP certificate request.Send the AP certificate request to the CA.Issue the certificate.Install the AP certificate.
8. Configure the WGB SSID, Supplicant and Radio as Needed
9. Configure Entries for a Passive Client (If Necessary)
10. Special Notes if 802.11a (5 GHz) is Used
11. Synchronize the Cisco IOS supplicant's clock and save its time to NVRAM (for systems with Cisco IOS Software Release 12.4(21a)JY)

Configure

In this section, you are presented with the information to configure the features described in this document.

Note: Use the Command Lookup Tool (registered customers only) in order to obtain more information on the commands used in this section.

Bring up the Microsoft CA (If Necessary)

Complete these steps in order to open the Microsoft CA with the use of Windows 2003 Advanced Server:

1. First, have IIS installed. Choose **Control Panel > Add/Remove Programs > Windows Components > Application Server**.
2. Then, install the CA. Choose **Control Panel > Add Remove Programs > Windows Components > Certificate Services**.Choose an **Enterprise Root CA**.Give the CA a name, and make a note of it.

Install the Server Certificate in the ACS

Complete these steps in order to install the server certificate in the ACS.

1. From a browser that runs on the ACS server, browse to the CA: **http://ip.of.CA.server/certsrv**Request a **Certificate > Advanced Request > Create and Submit a request to this CA**.In the Name (CN) field, enter something. Make a note of it.In the Type of Certificate Needed drop-down menu, choose **Server Authentication Certificate**.Under key options, choose:CSP — Microsoft Base Cryptographic Provider v1.0Key size — 1024Check **Mark keys as exportable**.Check **Store cert in the local computer cert store**.Leave everything else as default, and click **Submit**.You should see a `Certificate Pending` status report that says `Your certificate request has been received.` If you have a problem, see MS KB 323172, or other things that can get in the way of Active X.

2. Now, on the CA, go into the CA admin utility and choose **Start > Administrative Tools > Certification Authority**.On the left, expand the CA icon, and look under Pending Requests.On the right, right-click the request from the ACS and choose **All Tasks > Issue**. The request should now appear under Issued Certificates.
3. Back on the ACS server, browse again to **http://ip.of.CA.server/certsrv**.Click **View the status of a pending certificate request**.Click **Server Authentication Certificate**.Click **Install this certificate**.

Install the CA Certificate on the ACS

Complete these steps:

From a browser that runs on the ACS server, browse to the CA: **http://ip.of.CA.server/certsrv**

1. Click **Download a CA certificate, certificate chain, or CRL**.
2. Choose **Encoding method: Base 64**.
3. Choose **Download CA certificate**.
4. Open the .cer file, then click **Install Certificate**.
5. In the Certificate Import Wizard, click **Next**, then **Place all certificates in the following store**, then **Browse**.
6. Check the **Show physical stores** box.
7. Expand **Trusted root certification authorities**, choose **Local Computer**, and click **Ok**.
8. Click **Next**, **FINISH**, and **OK** for `The import was successful` box.

Setup the ACS to Use the Server Certificate

Complete these steps:

1. On the ACS server, choose **System Configuration**.
2. Choose **ACS Certificate Setup**.
3. Choose **Install ACS certificate**.
4. Choose **Use certificate from storage**.
5. Type in the CN name, the same name that was used in a previous step.
6. Click **Submit**.
7. In the ACS server, click **System configuration**.
8. Choose **ACS Certificate Setup**.
9. Choose **Edit Certificate Trust List**.
10. Check the box for the CA.
11. Click **Submit**.

Configure ACS to Let the WGB authenticate in EAP-TLS

Complete these steps in order to configure the ACS to let the WGB authenticate in ACS:

1. Add the WLC as a NAS (AAA client).In the ACS GUI, click **Network Configuration** on the left.Under AAA Clients, click **Add Entry**.Enter a name under AAA Client Hostname.Enter the management interface IP address of the WLC under AAA Client IP Address.Enter the RADIUS key under Shared Secret and make a note of it.In the Authenticate Using drop-down

menu, choose **RADIUS (Cisco Airespace)**.Click **Submit+Apply**.
2. Enable EAP-TLS in ACS.Choose **System Configuration > Global Authentication Setup**.Under EAP-TLS, for example, the top-level EAP-TLS, after EAP-FAST, not the EAP-TLS under PEAP, check **Allow EAP-TLS**.Check all three of the certificate verification options.Choose **Submit + Restart**.
3. Add the WGB as an ACS.In User Setup, enter the name of the WGB in the User panel, and click **Add/Edit**. This example uses "WGB".Enter a hard-to-guess password. This is required, although not used in EAP-TLS.Click **Submit**.

Configure the WLAN of the WLC to Authenticate to ACS

Complete these steps:

1. Browse to the GUI of the WLC.
2. Add the ACS to the RADIUS server list:Choose **Security > AAA > RADIUS > Authentication** and click **New**.Enter the ACS IP address in the Server IP Address panel.Enter the RADIUS shared secret from the previous step.Click **Apply**.
3. Add a WLAN for the EAP-TLS clients:Under WLANs, click **New**.Enter the SSID as the Profile Name and the WLAN SSID.In the General tab, check the **Enabled** checkbox, and Broadcast SSID (as desired).Under the Security tab:Under the Layer 2 tab, choose **WPA+WPA2** in the Layer 2 Security drop-down menu, check **WPA Policy with TKIP encryption**, uncheck **WPA2 policy with AES encryption**, and choose **802.1X for Auth Key Mgmt**.Under the AAA Servers, add the ACS, unless the ACS is the global default RADIUS server.Click **Apply**.

Configure the Certificates of the WGB

Complete these steps:

Note: This method uses the copy-and-paste method. Refer to Configuring Certificates Using the crypto pki CLI in the *Cisco 3200 Series Wireless MIC Software Configuration Guide* for more information on how to use the TFTP and SCEP methods.

1. Set the hostname, domain name and time of the WGB as needed.The hostname must match the username entered for it in ACS as in the previous step:
```
ap#configure terminal
ap(config)#hostname WGB
WGB(config)#
```
The time must be correct, for the certifications to work (clock set exec CLI, or configure an sntp server).
2. Configure the trustpoint for the CA:
```
WGB#config term
WGB(config)#crypto pki trustpoint CUT-PASTE
WGB(config)#enrollment terminal
WGB(config)#subject-name CN=WGB
```

Note: `subject-name CN=<ClientName>` is required. Without it, the Microsoft CA fails to issue the cert, with the `The request subject name is invalid or too long. 0x80094001` error message.
```
WGB(config)#revocation-check none
```

Note: The **revocation-check none** command is necessary to avoid the problem described

in Cisco bug ID CSCsl07349 (registered customers only) . WGB disassociates/reassociates often and takes a long time to reconnect.

```
WGB(config)#rsakeypair manual-keys 1024
```

3. Install the CA cert on the WGB:Get a copy of the CA cert:Browse to the CA: **http://ip.of.CA.server/certsrv**Click **Download a CA certificate, certificate chain, or CRL**.Choose **Encoding method: Base 64**.Click **Download CA certificate**.Save the .cer file.Install the CA cert:

```
WGB(config)#crypto pki authenticate CUT-PASTE
Enter the base 64 encoded CA certificate.

End with a blank line or the word "quit" on a line by itself
```

Now, paste in the text from the .cer file downloaded in the previous step.

```
-----BEGIN CERTIFICATE-----
[ ... ]
-----END CERTIFICATE-----

quit

Certificate has the following attributes:

Fingerprint: 45EC6866 A66B4D8F 2E05960F BC5C1B76

% Do you accept this certificate? [yes/no]: yes

Trustpoint CA certificate accepted.

% Certificate successfully imported
```

4. Request and install the client certificate on the WGB:Generate the certificate request on the WGB:

```
WGB(config)#crypto pki enroll CUT-PASTE
% Start certificate enrollment ..

% The subject name in the certificate will include: CN=WGB
% Include the router serial number in the subject name? [yes/no]: no
% Include an IP address in the subject name? [no]: no
Display Certificate Request to terminal? [yes/no]: yes
Certificate Request follows:

MIIBjzCB+QIBADAvMQwwCgYDVQQDEwNXR0IxHzAdBgkqhkiG9w0BCQIWEFdHQi5j
Y2lld2lmaS5jb20wgZ8wDQYJKoZIhvcNAQEBBQADgY0AMIGJAoGBAMuyZ0Y/xI3O
6Pwch3qA/JoBobYcvKHlc0B0qvqPgCmZgNb8nsFDV8ZFQKb3ySdIxlqOGtrn/Yoh
2LHzRKi+AWQHFGAB2vkFD0SJD8A6+YD/GqEdXGoo/e0eqJ7LgFq0wpUQoYlPxsPn

MA4GA1UdDwEB/wQEAwIFoDANBgkqhkiG9w0BAQQFAAOBgQAsCItCKRtu16JmG4rz
cDROO1QdmNYDuwkswHRgSHDMjVvBmoqA2bKeNsTj+svuX5S/Q2cGbzC6OLN/ftQ7
fw+RcKKm8+SpaEnU3eYGs3HhY7W9L4MY4JkY8I89ah15/V82SoIAOfCJDy5BvBP6
hk7GAPbMYkW9wJaNruVEvkYoLQ==

---End - This line not part of the certificate request---

Redisplay enrollment request? [yes/no]: no
WGB(config)#
```

Request the Client/User certificate to the CA with the output previously gathered. Use a PC with access to the CA and request the User certificate using this method:Browse to the CA: http://ip.of.CA.server/certsrvChoose the "Request a certificate" option.Choose the "advanced certificate request" option.Choose the "Submit a certificate request by using a base-64-encoded CMC or PKCS #10 files, or submit a renewal request by using a base-64-encoded

PKCS #7 file" option.Paste in the certificate request that IOS generated from the "crypto pki enroll" command previously used, and just submit the request.Finally, just download the certificate as "Base 64 encoded".**Note:** You need to make sure that the certificate was actually generated for the WGB, with the Subject having "WGB" (the username you provided to the WGB) as the CN.Install the user certificate on the WGB:

```
WGB(config)#crypto pki import CUT-PASTE certificate
        Enter the base 64 encoded certificate.
        End with a blank line or the word "quit" on a line by itself
```

Now, paste in the text from the .cer file downloaded in the previous step.

```
        -----BEGIN CERTIFICATE-----
        [ ... ]
        -----END CERTIFICATE-----

% Router Certificate successfully imported
```

5. Verify the certifications from the WGB CLI:

```
WGB#show crypto pki certificates
Certificate
  Status: Available
  Certificate Serial Number: 1379B07200000000000C
  Certificate Usage: General Purpose
  Issuer:
    cn=AARONLAB
  Subject:
    Name: WGB
    cn=WGB
  CRL Distribution Points:
    http://wcswin/CertEnroll/AARONLAB.crl
  Validity Date:
    start date: 11:33:09 MST Mar 3 2008
    end   date: 11:43:09 MST Mar 3 2009
  Associated Trustpoints: COPY-PASTE

CA Certificate
  Status: Available
  Certificate Serial Number: 612683248DBA539B44B039BD51CD1D48
  Certificate Usage: Signature
  Issuer:
    cn=AARONLAB
  Subject:
    cn=AARONLAB
  CRL Distribution Points:
    http://wcswin/CertEnroll/AARONLAB.crl
  Validity Date:
    start date: 16:34:48 MST Feb 28 2008
    end   date: 16:41:25 MST Feb 28 2018
  Associated Trustpoints: COPY-PASTE
```

Configure the WGB SSID, Supplicant and Radio as Needed

Complete these steps:

1. Configure the SSID. This should match the SSID configured on the WLC in this previous step:

```
dot11 ssid EAPTLS
   authentication network-eap eap_methods
   authentication key-management wpa version 1
   dot1x credentials EAPTLS
   dot1x eap profile EAPTLS
   infrastructure-ssid
```

2. Configure the EAP-TLS supplicant. The username must match the CN on the trustpoint and the username entry in ACS.

```
eap profile EAPTLS
 method tls
!
dot1x credentials EAPTLS
 username WGB
 pki-trustpoint CUT-PASTE
```

3. Configure the radio interface as needed. In this example, the 2.4 GHz radio (Dot11Radio0) is used.

```
interface Dot11Radio0
 encryption mode ciphers aes-ccm tkip
 ssid EAPTLS
 !
 packet retries 128 drop-packet
 station-role workgroup-bridge
```

Note: With `packet retries 128 drop-packet`, the WGB remains associated to its root AP as long as it can, so this is a suitable configuration for an immobile WGB. For a WGB that is physically roaming, these configurations can be used, in order of increasingly aggressive roaming:

```
packet retries 128
```

Note: or

```
packet retries 128
mobile station period 5 threshold 82
(tune the mobile station command as needed for a specialized application)
```

Configure Entries for a Passive Client (If Necessary)

If one or more "passive clients" are behind the WGB, for example, wired devices that have static IP addresses and that do not continuously transmit unsolicited IP data, then special steps need to be taken in order to ensure that the WGB and the CUWN can find those clients. In this example, the client has an IP address of 10.0.47.66 and a MAC address of 0040.96b4.7e8f.

Complete these steps in order to use this method:

1. Configure a static bridge entry on the WGB for the client:

```
B(config)#bridge 1 address 0040.96b4.7e8f
forward fastethernet0
```

2. Configure a static MAC-to-IP address mapping on the WLC:Configure the WLAN in order to enable MAC filtering, AAA override, and not to require DHCP:

```
(Cisco Controller) >show wlan summary

!--- Make a note of the WLAN ID for the SSID used for EAP-TLS. (Cisco Controller) >config
wlan disable 6
(Cisco Controller) >config wlan mac-filtering enable 6
(Cisco Controller) >config wlan aaa-override enable 6
(Cisco Controller) >config wlan dhcp_server 6 0.0.0.0
!--- Do not have DHCP required checked.
```

Add the MAC filter (MAC-to-IP mapping) for each client:

```
(Cisco Controller) >config macfilter add
  0040.96b4.7e8f 6 management "client1" 10.0.47.66
```

Special Notes if 802.11a (5 GHz) is Used

Since 802.11a supports many more channels than 802.11b/g (2.4 GHz), it can take the WGB much longer to scan all available channels. Therefore, outages while you roam in 5 GHz, or after a connectivity problem to the root AP, can last for several seconds. Additionally, if you use DFS channels, channel scanning can take much longer, and brief outages after a DFS radar detection event can occur.

It is therefore recommended that if you use 802.11a, you should avoid the use of DFS channels, for example, in the FCC domain, and to use only the UNII-1 and UNII-3 bands. The Dot11Radio1 interface of the WGB should also be configured to scan only the channels in use in the coverage area. For example:

```
WGB(config-if)#mobile station scan
  36 40 44 48 149 153 157
```

Configurations

Here is an example WGB configuration for an AP1242, that uses Cisco IOS Software Release 12.4(10b)JA2, EAP-TLS authentication with WPA1-TKIP, 2.4 GHz.

Note: Some lines of this configuration have been moved to the second line due to space constraints.

Synchronize the Cisco IOS supplicant's clock and save its time to NVRAM (for systems with Cisco IOS Software Release 12.4(21a)JY)

A Cisco IOS device whose supplicant is configured to perform certificate-based authentication of its network connection, which device is hereafter referred to as *the Supplicant*, may be unable to connect to the network, unless these steps are taken.

In order to make sure that the Supplicant, after a reload but before it has connected to the network, knows approximately what time it is, so that it can validate the certificate of the server, you must configure the Supplicant to learn the time from an NTP server, and to write the time to its NVRAM. This is a requirement for any system that runs Cisco IOS Software Release 12.4(21a)JY.

Complete these steps:

1. Configure the Supplicant to synchronize its time to a known good NTP server, to which the Supplicant has network access, and to store its time into its NVRAM.**Example 1.1. (on a system with SNTP, and without a hardware calendar):**
   ```
   Supp(config)#sntp server 10.0.47.1
   Supp(config)#clock save interval 8
   Supp(config)#end
   Supp#write memory
   ```

   Example 1.2. (on a system with NTP, and with a hardware calendar):
   ```
   Supp(config)#ntp server 10.0.47.1 iburst
   Supp(config)#ntp update-calendar
   Supp(config)#end
   Supp#write memory
   ```

2. Make sure that the Supplicant has network connectivity to the NTP server and has synchronized its time.**Example 2.1:**
   ```
   Supp#show sntp
   SNTP server     Stratum   Version    Last Receive
   10.0.47.1          3         1        00:00:09     Synced
   ```
   Example 2.2:
   ```
   Supp#show ntp status
    Clock is synchronized, stratum 4, reference is 10.95.42.129
    [ ... ]
   ```
3. Make sure that the correct time is saved to the hardware calendar of the Supplicant if it has one, or to NVRAM if it does not.**Example 3.1. On a system with no hardware calendar:**Reload the Supplicant in order to make sure that the time is saved to NVRAM. After it reloads, verify that the time is approximately correct, even when the NTP server is unavailable:
   ```
   Supp#show clock detail
    *08:24:30.103 -0700 Thu Apr 15 2010
    No time source
   ```
   Example 3.2. On a system with hardware calendar: Write the current, correct time to the

hardware calendar:

```
Supp#clock update-calendar
```

Verify that the calendar is correct:

```
Supp#show calendar
```

Verify

Use this section to confirm that your configuration works properly.

The Output Interpreter Tool (registered customers only) (OIT) supports certain **show** commands. Use the OIT to view an analysis of **show** command output.

Verify the WGB connection.

On the WLC, the radio MAC address of the WGB should appear as an Associated client. For example:

```
(Cisco Controller) >show client summary

Number of Clients................................ 5

MAC Address       AP Name          Status     WLAN/    Auth Protocol Port Wired
                                              Guest-Lan
----------------- ---------------- ---------- -------- ---- -------- ---- -----

00:00:39:dd:4d:24 AP0019.e802.3034  Associated    6     Yes  N/A       4    No
00:0e:9b:cb:d3:9c AP0019.e802.3034  Associated    1     No   802.11b   4    No
00:16:6f:50:e1:25 AP0019.e802.3034  Probing       N/A   No   802.11b   4    No
00:19:56:b0:7e:b6 AP0019.e802.3034  Associated    6     Yes  802.11b   4    No
00:40:96:b4:7e:8f AP0019.e802.3034  Associated    6     Yes  N/A       4    No
Use "show client detail <MAC>" to see more information on the WGB:
(Cisco Controller) >show client detail 00:19:56:b0:7e:b6
Client MAC Address.............................. 00:19:56:b0:7e:b6
Client Username ................................ WGB
AP MAC Address.................................. 00:19:a9:42:e4:10
Client State.................................... Associated
Workgroup Bridge................................ 2 client(s)
Wireless LAN Id................................. 6
BSSID........................................... 00:19:a9:42:e4:15
Channel......................................... 1
IP Address...................................... 10.0.47.23
```

On the WGB, you can use the **show dot11 associations** and **show dot11 associations all-clients** commands in order to see more detail about the association to the AP. Use the **ping w.x.y.z** command in order to ping the WGB's default gateway.

Verify the WGB's client connectivity.

On the WGB, you can use the **show bridge 1 fastethernet0** command in order to see addresses learned through the FastEthernet0 interface:

```
WGB.Cisco.COM#show bridge 1 fastethernet0
```

```
Total of 300 station blocks, 292 free
Codes: P - permanent, S - self

Bridge Group 1:

Troubleshoot

This section provides information you can use to troubleshoot your configuration.

Troubleshooting Commands

The Output Interpreter Tool (registered customers only) (OIT) supports certain **show** commands. Use the OIT to view an analysis of **show** command output.

Note: Refer to Important Information on Debug Commands before you use **debug** commands.

Debugging Examples

- WGB-side example
- WLC-side example

WGB-side example

On the WGB, this example assumes 2.4 GHz; if you use 5 GHz, specify `Dot11Radio1` instead of `Dot11Radio0`.

```
WGB#no debug dot11 dot11radio0 print printf
!--- This runs the radio debugs through !--- the standard Cisco IOS logger. WGB#debug
dot11 dot11radio0 trace print mgmt uplink
!--- radio driver debugs: 802.11 management frames !--- and uplink events WGB#debug
dot11 supp-sm-dot1x
!--- interface to the 802.1X supplicant
```

Here is an example of a normal association given in the previous configuration:

WGB-side Example

```

Processing Access-Challenge for mobile 00:19:56:b0:7e:b6
!--- The WLC forwards the ID-request info, !--- that it
had received !--- in 802.1X from the WGB supplicant, to
the RADIUS server, !--- in a RADIUS Access-Request
packet. !--- The RADIUS server responds with an Access-
Challenge. !--- If there is a configuration problem with
RADIUS, then either !--- the RADIUS server does not
respond, or it responds !--- with a RADIUS Access-
Reject. !--- If EAP-TLS goes well, there is much back
and forth !--- between the EAP exchange on the wireless
!--- link, and the RADIUS exchange between the WLC and
ACS. Tue Mar 4 16:45:59 2008: 00:19:56:b0:7e:b6 Entering
